

Stockyard vs LiteLLM

A comprehensive comparison of LLM proxy platforms

EXECUTIVE SUMMARY

Both Stockyard and LiteLLM solve the LLM proxy problem: unified API, provider abstraction, and cost tracking. Stockyard goes further by shipping 16 integrated apps (observability, audit trails, workflows, prompt lab, billing, RBAC, marketplace) as a single zero-dependency binary. LiteLLM focuses on the proxy layer and requires external tools for everything else.

FEATURE COMPARISON

Feature	Stockyard	LiteLLM
Deployment	Single binary, no deps	Python + Redis + Postgres
Provider support	16 providers	100+ providers
Middleware modules	66 modules	~10 hooks
Observability	Built-in (Observe app)	External (Langfuse etc.)
Audit trail	Hash-chained ledger	Not included
Prompt management	Built-in (Studio app)	Not included
Workflow engine	Built-in (Forge app)	Not included
Per-customer billing	Built-in + Stripe	Via callbacks
RBAC	Built-in (Team app)	Via proxy keys
Marketplace	Exchange packs + App Store	Not included
AI assistant	Copilot (NL config)	Not included
Incident response	Recall (auto-scan PII)	Not included
Compliance	SOC2/HIPAA/GDPR evidence	Not included
GPU sharing	Mesh network (12% fee)	Not included
API endpoints	350+	~30
Binary size	~25MB	N/A (Python)
Storage	SQLite (embedded)	PostgreSQL (external)
Open source	Yes (Go)	Yes (Python)
Pricing	Free / \$29 / \$99 / \$299	Free / Enterprise

WHEN TO CHOOSE STOCKYARD

Choose Stockyard when you need a complete LLM infrastructure platform: observability, audit trails, prompt management, workflow orchestration, per-customer billing, RBAC, compliance evidence, and marketplace features in a single deployment with no external dependencies.

WHEN TO CHOOSE LITELLM

Choose LiteLLM when you only need a proxy layer with maximum provider coverage and you already have separate tools for observability, billing, and orchestration, or when you need Python-native integration with your existing stack.
